

# Assignment Questions 6

## Question 1

A permutation perm of  $n + 1$  integers of all the integers in the range  $[0, n]$  can be represented as a string  $s$  of length  $n$  where:

- $s[i] == 'I'$  if  $\text{perm}[i] < \text{perm}[i + 1]$ , and
- $s[i] == 'D'$  if  $\text{perm}[i] > \text{perm}[i + 1]$ .

Given a string  $s$ , reconstruct the permutation perm and return it. If there are multiple valid permutations perm, return **any** of them.

**Example 1:**

**Input:**  $s = "IDID"$

**Output:**

$[0,4,1,3,2]$

## Question 2

You are given an  $m \times n$  integer matrix matrix with the following two properties:

- Each row is sorted in non-decreasing order.
- The first integer of each row is greater than the last integer of the previous row.

Given an integer target, return true *if target is in matrix* or false *otherwise*.

You must write a solution in  $O(\log(m * n))$  time complexity.

**Example 1:**

1	3	5	7
10	11	16	20
23	30	34	60

**Input:** matrix =  $[[1,3,5,7],[10,11,16,20],[23,30,34,60]]$ , target = 3

**Output:** true

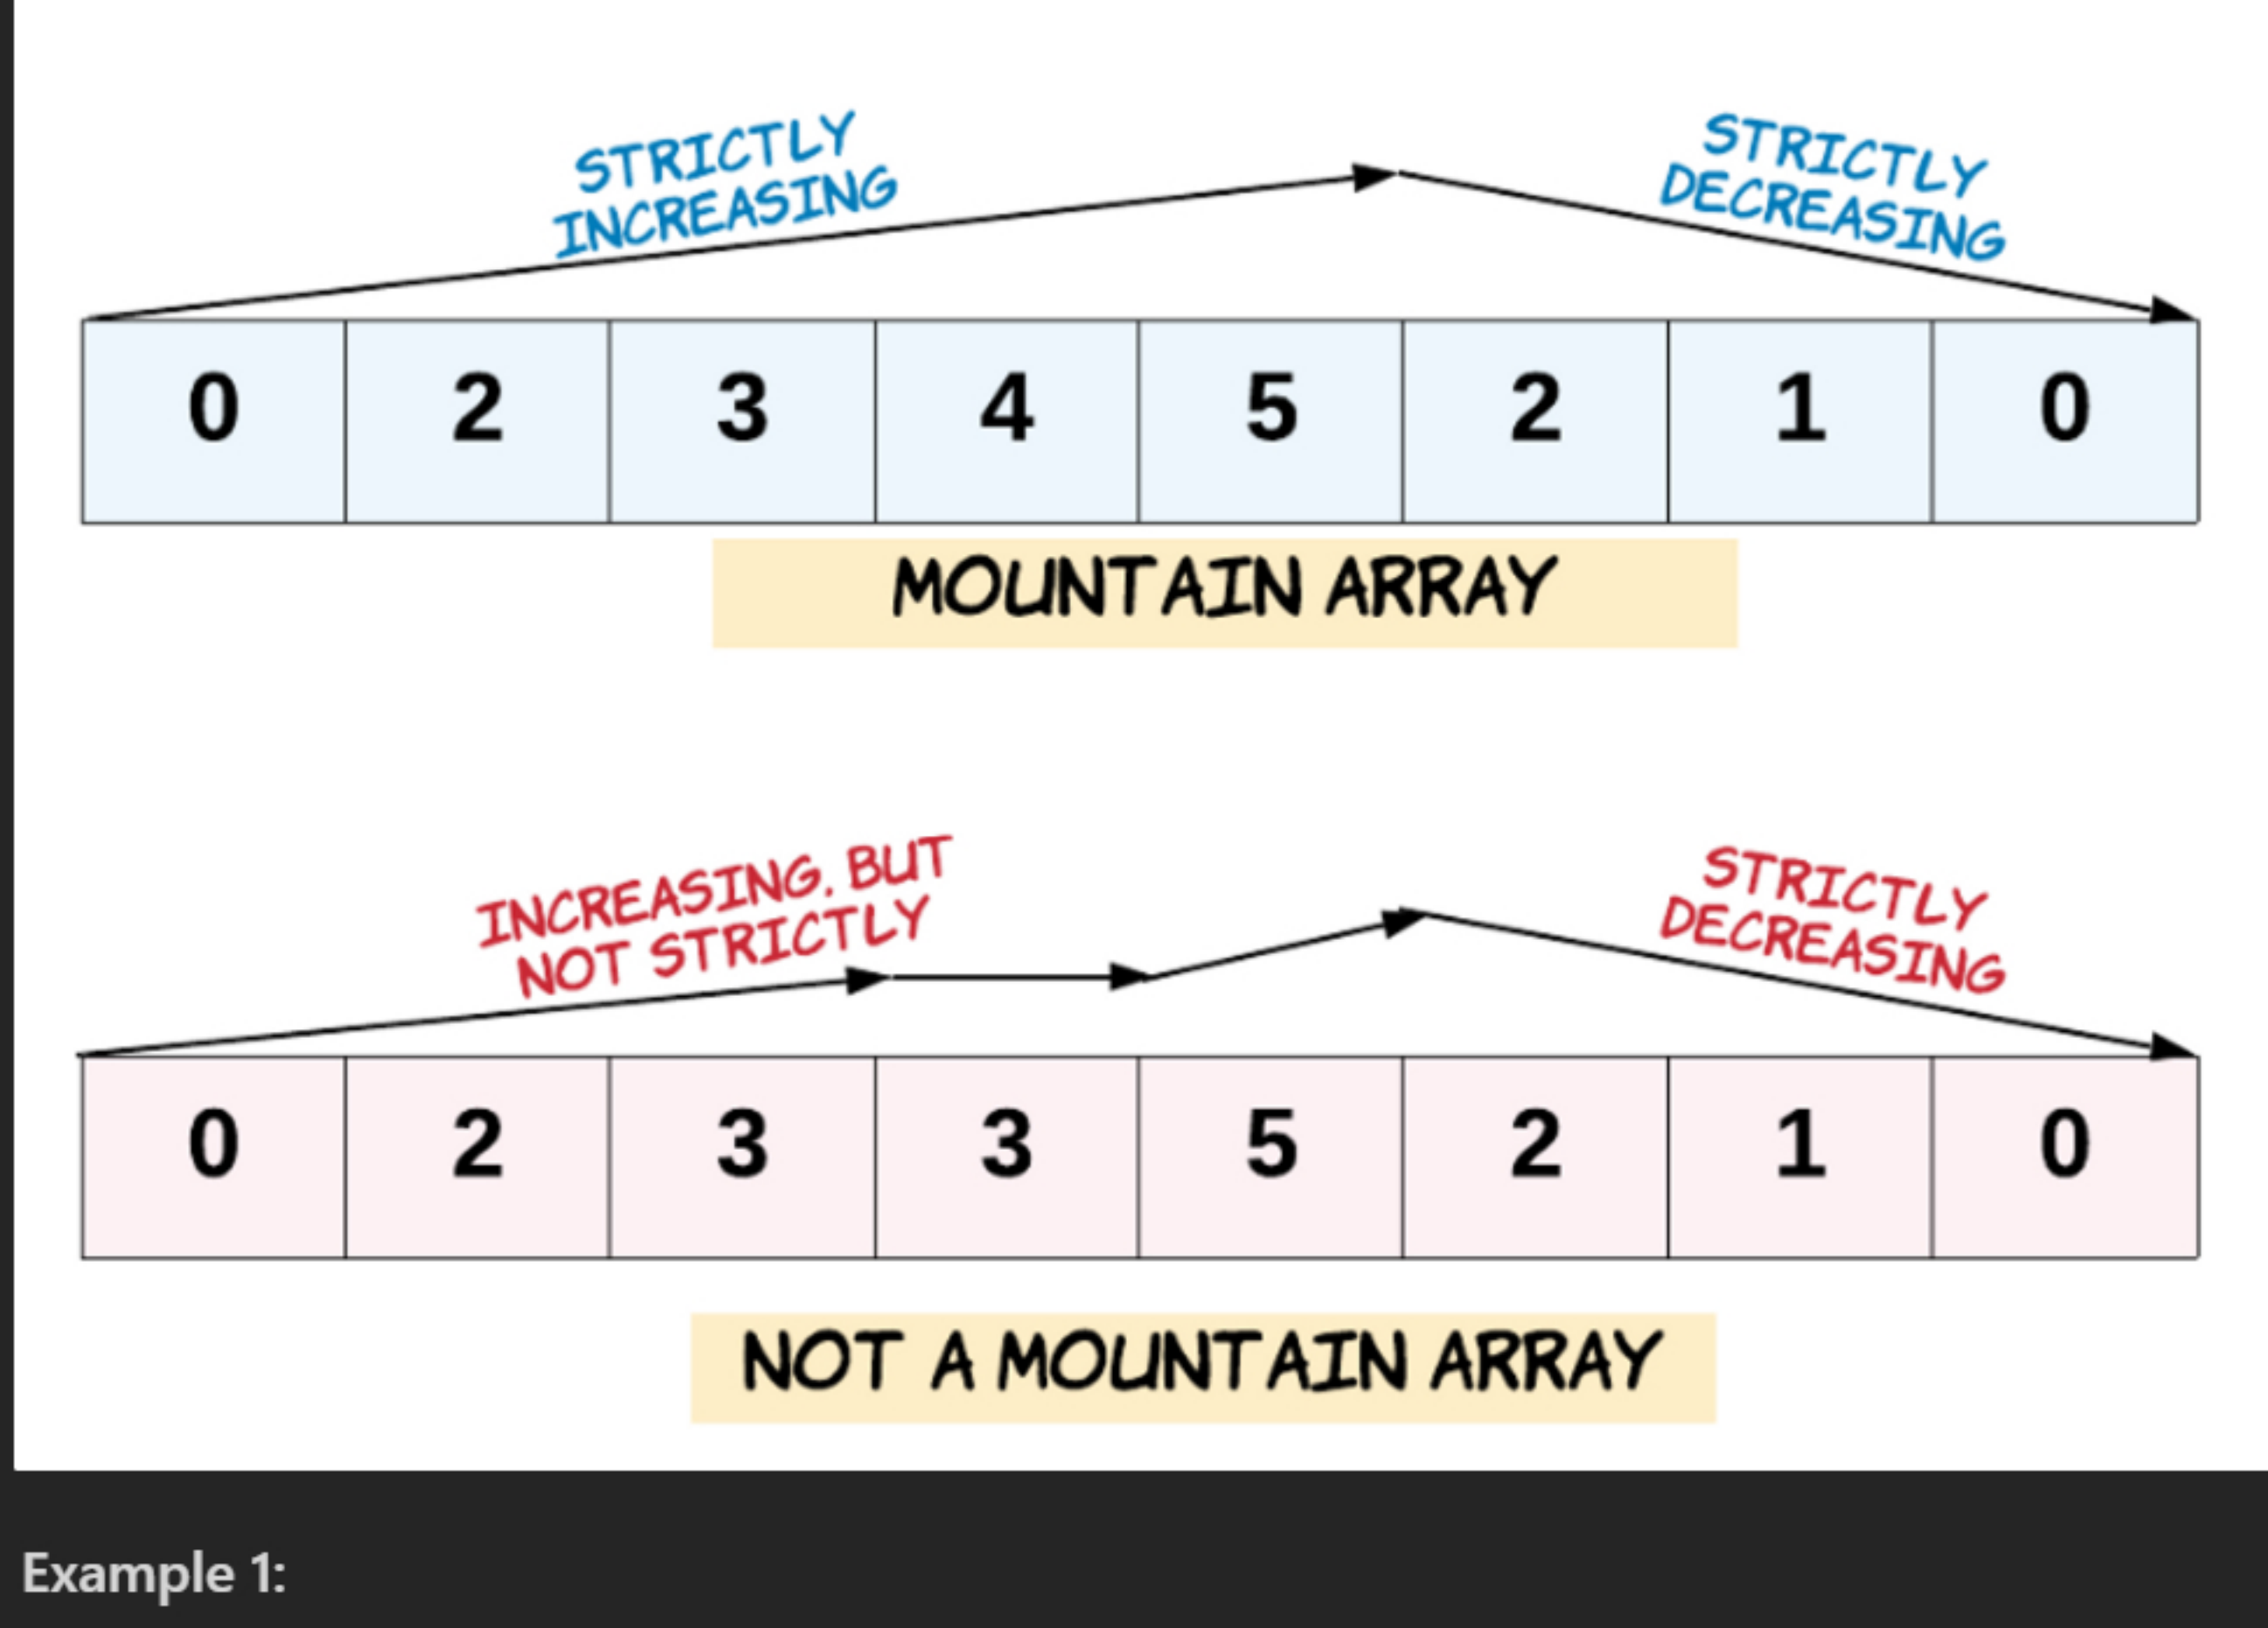

## Question 3

Given an array of integers arr, return true *if and only if it is a valid mountain array*.

Recall that arr is a mountain array if and only if:

- $\text{arr.length} \geq 3$
- There exists some  $i$  with  $0 < i < \text{arr.length} - 1$  such that:
  - $\text{arr}[0] < \text{arr}[1] < \dots < \text{arr}[i - 1] < \text{arr}[i]$
  - $\text{arr}[i] > \text{arr}[i + 1] > \dots > \text{arr}[\text{arr.length} - 1]$

**Example 1:**

**Input:** arr =  $[2,1]$

**Output:**

false

## Question 4

Given a binary array nums, return the *maximum length of a contiguous subarray with an equal number of 0 and 1*.

**Example 1:**

**Input:** nums =  $[0,1]$

**Output:** 2

**Explanation:**

$[0, 1]$  is the longest contiguous subarray with an equal number of 0 and 1.

## Question 5

The **product sum** of two equal-length arrays  $a$  and  $b$  is equal to the sum of  $a[i] * b[i]$  for all  $0 \leq i < a.\text{length}$  (0-indexed).

- For example, if  $a = [1,2,3,4]$  and  $b = [5,2,3,1]$ , the **product sum** would be  $1*5 + 2*2 + 3*3 + 4*1 = 22$ .

Given two arrays nums1 and nums2 of length  $n$ , return the *minimum product sum if you are allowed to rearrange the order of the elements in nums1*.

**Example 1:**

**Input:** nums1 =  $[5,3,4,2]$ , nums2 =  $[4,2,2,5]$

**Output:** 40

**Explanation:**

We can rearrange nums1 to become  $[3,5,4,2]$ . The product sum of  $[3,5,4,2]$  and  $[4,2,2,5]$  is  $3*4 + 5*2 + 4*2 + 2*5 = 40$ .

## Question 6

An integer array original is transformed into a **doubled** array changed by appending **twice** the value of every element in original, and then randomly **shuffling** the resulting array.

Given an array changed, return original *if changed is a doubled array*. If changed is not a **doubled** array, return an empty array. The elements in original may be returned in **any** order.

**Example 1:**

**Input:** changed =  $[1,3,4,2,6,8]$

**Output:**  $[1,3,4]$

**Explanation:** One possible original array could be  $[1,3,4]$ :

- Twice the value of 1 is  $1 * 2 = 2$ .
- Twice the value of 3 is  $3 * 2 = 6$ .
- Twice the value of 4 is  $4 * 2 = 8$ .

Other original arrays could be  $[4,3,1]$  or  $[3,1,4]$ .

## Question 7

Given a positive integer  $n$ , generate an  $n \times n$  matrix filled with elements from 1 to  $n^2$  in spiral order.

**Example 1:**

1	2	3
8	9	4
7	6	5

**Input:**  $n = 3$

**Output:**  $[[1,2,3],[8,9,4],[7,6,5]]$

## Question 8

Given two sparse matrices mat1 of size  $m \times k$  and mat2 of size  $k \times n$ , return the result of  $\text{mat1} \times \text{mat2}$ . You may assume that multiplication is always possible.

**Example 1:**

1	0	0
-1	0	3

 $\times$ 

7	0	0
0	0	0
0	0	1

 $=$ 

7	0	0
-7	0	3

**Input:** mat1 =  $[[1,0,0],[-1,0,3]]$ , mat2 =  $[[7,0,0],[0,0,0],[0,0,1]]$

**Output:**

$[[7,0,0],[-7,0,3]]$
